

Diabetes, when untreated, leads to damage to several organs within the body, particularly the kidneys. This damage may also go undetected for several years, until the later stages of kidney failure are reached, with a need for kidney replacement therapy - either dialysis or transplantation. Such progression is not inevitable. With good management, diabetes can be well controlled and kidney function can be maintained; to a certain extent, the damage can even be reversed. Diabetes and the Kidney is written for people with diabetes, their families and carers. It describes the function of the kidneys, the development of nephropathy, the ways to recognize it early and the correct way to manage it. The title emphasizes how people should take responsibility for their own health, with information on diet, giving up smoking and taking exercise. Clearly written description of kidney function, how it goes wrong in diabetic nephropathy and ways to prevent this Guidance on diet, exercise and generally encouraging people to become involved in their own health care Information on treatment of kidney disease and kidney replacement therapy

If you have diabetes, your blood glucose, or blood sugar, levels are too high. Over time, this can damage your kidneys. If they are damaged, waste and fluids build up in your blood instead of leaving your body. Kidney damage from diabetes is called diabetic nephropathy.

Diabetes and the kidneys. Atlas 8e complications image kidney Kidney disease ( nephropathy) is far more common in people with diabetes than in people.

Diabetes is the leading cause of kidney disease in Canada. Over the long term, high blood sugar levels damage tiny blood vessels in the kidneys, impairing their ability to filter the blood properly. As a result, a type of protein called albumin spills into the urine instead of being processed into the blood stream.

Diabetes is the number one cause of kidney failure. Find out more about diabetic neuropathy from WebMD.

One cause of kidney failure is diabetes mellitus, a condition characterised by high blood glucose (sugar) levels. Over time, the high levels of sugar in the blood . Type 2 diabetes mellitus (DM) globally affects 18â€“20 % of adults over the age of 65 years. Diabetic kidney disease (DKD) is one of the most. Having type 2 diabetes can increase your chances of developing kidney disease. These simple changes can help reduce your risk.
